Regular servicing and maintenance of your Pontiac Firebird can help maintain its resale value, save you money, and make it safer to drive. Take your entire manual with you on every journey. Under the skins it was quite conventional however, with a range of V6 and V8 engines and rearwheel drive, although it did also have antilock brakes and some composite bodywork. Come 1995, standard Firebirds were only available with a 3.8liter V76 engine, while Formula and Trans Am Firebirds had a 5.7liter V8 lifted from the Chevrolet Corvette.

Throughout its life the Firebird was tweaked to have greater performance, better handling, and more luxurious interiors. In 1998, the car was given a significant facelift, disc brakes all round and traction control for all models. Haynes has an extensive range of Pontiac repair manuals and online maintenance procedures to suit professional mechanics and DIY car enthusiasts. Our Pontiac Firebird repair manual will be able to help whether you're servicing or repairing your car. Honda didn't disappoint at the 2009 Los Angeles auto show, with the new PNut concept car. That stands for PersonalNeo Urban Transport, in case you were wondering. It's quite a different kettle of fish bag of nuts from last year's striking supercar hybrid concept car shown a year ago almost to the day. And we knew that car makers across the world were cutting production levels to cope with the huge stock of cars they had. But figures just released show how dramatic the falloff in car production has been. [Learn more opens in a new window or tab](#) This amount is subject to change until you make payment. Bad luck This site, like most others, needs JavaScript to function properly. The Firebird was introduced the same year as the automakers platformsharing model, the Chevrolet Camaro. This coincided with the release of the 1967 Mercury Cougar, which shared its platform with another pony car, the Ford Mustang. While primarily Pontiacpowered until 1977, Firebirds were built with several different engines from nearly every GM division until 1982 when GM began to discontinue engines it felt were unneeded and either spread successful designs from individual divisions among all divisions or use new engines of corporate architecture. These cars were built on the Fbody platform, which was also shared by the Chevrolet Camaro. The third generation, available from 1982 to 1992, was featured in the 1983 movie Smokey and the Bandit Part 3 and the 1984 movie Alphabet City. KITT, the automotive star, and its evil counterpart KARR, of the popular 1980s TV series Knight Rider, was a modified third generation Trans Am. The fourth generation Trans Am, available from model years 1993 to 2002, offered between 275 bhp 205 kW and 325 bhp 242 kW. Fuel gasoline.

This daemon is the Firebird engine — without it, nothing will run under Superserver. From Firebird 3.0 onwards, this utility will no longer be present in the Firebird releases. You are advised to use the fbguard utility instead. See the chapter on fbguard for details. Windows will be discussed separately in this manual for that reason. This means that Firebird is available whenever your system is running once you have Firebird installed. The engine runs as the firebird user and not as root. If already running, does nothing.

The engine is started under the watchful eye of the guardian process fbguard and is set to automatically restart if the engine fails for any reason. The engine runs under the firebird user even though you have to be root to run the rcfirebird script. If already stopped, does nothing. If the process is not running, no error is reported. You can check if it is available on your installation by running the rcfirebird command with no parameters To do this, and assuming that either none of the options to rcfirebird are suitable or you do not have root privileges, fbmgr is your tool.The

commands are identical whichever mode you use and the following section describes the commands and shows examples of each, running in both modes. Command switches user and password can also be used. For example, to shutdown server you can. The guardian will restart the engine any time it determines that the engine has crashed and in doing so, will hopefully reduce the downtime that the users may suffer as a result of a crashed engine. To perform this task manually using fbmgr you would carry out one of the following. If you log in as any other user, even supplying a user name will not be enough to allow you to restart a closed database engine. This means that it can start and stop the engine without being required to authenticate as SYSDBA. At present there are four login names that are assumed to be privileged, these are SYSDBA, SYSTEM, SYSOPER, and SYSRAC. At other times, however, you may wish for any crashes to be investigated prior to restarting the engine. This is possible using fbmgr as the following shows. If this was not the case, it would be very difficult to actually stop the Firebird engine! This is a slight inconsistency as only the privileged users can start the engine. If you are running fbmgr as a privileged user, then the user will be SYSDBA unless you specified a different one with the user parameter.

User SYSDBA User NORMAN User SYSDBA User NORMAN It is unfortunate that the show command doesn't show any details about the running or otherwise Firebird engine. You can find this out as follows. This indicates that the engine is running and is in once mode. If it crashes at any time, it will not be restarted by the guardian. In forever mode, the parameter is f. The following two grep commands produce identical results but using the character class in the first saves having to call grep v grep to filter out the unwanted grep process. There is no quit command for batch mode. The fbguard utility, which was actually used by fbmgr, should be used instead. The system start and stop scripts, as described in the previous chapter, use fbguard to start and stop the Firebird engine at system startup and shutdown. Running fbguard on its own makes no such checks and can lead to databases becoming unavailable due to being owned by root, for example — because this command always runs the Firebird engine as the root user. This may be a cause of serious concern for system administrators. If you create any databases while the engine is running as root then those databases will be owned by root and you will not be able to access it at some future point when the engine runs — correctly — as the firebird user. If you use fbguard to start the engine, you need to kill the fbserver process to stop it. You cannot shut down the engine with rcfirebird stop, for example, if you started it with fbguard. The resulting output is as follows. If you run the fbguard command to start the engine from a terminal session, your terminal will hang. You may tell it to use a specific pidfile, if you wish, by specifying the pidfile option. It is possible, however, to force the engine to be started up and the guardian will allow it to stay down if it detects a crash. Startup errors include problems such as port 3050 already being used, etc.

Normally, on a startup error fbguard will make no further attempt to start the engine. To perform this task manually using fbguard you would carry out the following process. At other times, however, you may wish for any crashes to be investigated prior to restarting the engine. This is possible using fbguard as the following shows. To do so requires that you kill the running process as root. For best results and stability, you are advised to keep Firebird running as a service rather than as an application. If you wish to control when the services are started and stopped, use Control Panel to change their properties to manual. In this case, an icon will be seen in the system tray and you can carry out manual maintenance by right clicking on the icon. All the engine commands are accessed via a rightclick on the guardian icon in the system tray when running as an application. It can also be used to start and stop services that already exist. When discussing the instsvc command below, it will be used only to start and stop services rather than installing and removing them. From Version 2.1 onwards, there can be many different services running. As there are spaces in the names, double quotes are required to prevent errors. The Firebird Guardian DefaultInstance service was started successfully. It is easier to use instsvc to start the services as you do not need to know the default service names. The Firebird Guardian DefaultInstance service was stopped successfully. Once again,

the instsvc command is used Firebird Server DefaultInstance IS installed. Other details are displayed such as whether or not these services are started automatically on reboot — in the example above, this is not the case — and the user account LocalSystem under which the services will be run, when they are started. The reason is simple, Windows doesn't have an fbmgr application as it uses the instsvc command instead. You are advised to use fbguard instead.

There is a very brief mention of the start command, but no text explains its use, unlike the other commands which are described. When the server boots, it starts the Firebird engine and runs it as the user firebird. While existing databases — owned by the firebird user — will happily be read from and written to by root, any new databases created will be owned by root. Everything will work fine for a while but after the server is next rebooted, these new databases will then fail to be accessible as the engine is now running as the firebird user again and that user has no permissions to access the databases owned by root. If you follow the above instructions, all your databases will be owned by the firebird user. This again is not a major problem, but knowing that all you have to do is exit from fbmgr to make it vanish is helpful. If, on the other hand, you log in as any other user and try to use fbmgr to stop and start the Firebird engine, you will find that you can stop it with no problems but you will not be allowed to restart it. Only privileged users can start the engine. The following shows the problem. Until the firebird engine is started, there is no way to check that the password supplied for the SYSDBA user is actually correct. Because of this, logging in as a privileged user assumes SYSDBA privileges and allows you to start the engine. Text amended to warn the reader of this discrepancy.
